Interview coding challenge

Microservice for the coding challenge

Below you find the link to the GitHub project, please fork it for you and send us the link for your version as soon as you're done.

https://github.com/DevOpsESolutionTesto/time-booking-service

The service recommends `adoptopenjdk:11` to be installed, but node and npm are not required to solve this challenge. In the end, we don't check if it works but how the implementation looks like.

Features

Below are described two features for you to implement. Please focus on the first one and if some time is left you can start with it. Limit your invested time to a maximum of 1 hour and treat your solution more as a PoC rather than a real working solution. You can mix your implementation with code comments marked with `// TODO ...` so we can see what you would also implement.

#1 Feature calculate working time:

As Human resources, we want to retrieve how many hours an employee worked.

#2 Feature check and inform for missing bookings

As Human resources, we want that tool automatically informs when an employee forgot to book his time on the same day
